

SELF-HELP GUIDE BLEEDING RADIATORS

Advice on bleeding radiators

Following advice from our gas contractors and Valliant UK, we strongly recommend that you **do not** attempt to bleed your own radiators. The reasons for this are:

- Bleeding radiators draws more air into the system causing pressure problems and allowing for more corrosion in the system.

Sealed systems should not need bleeding for unwanted air as there are no areas for air to escape.

- If a radiator has excess air or a blockage, it could mean that there is a leak.
- When bleeding a radiator you may cause more damage or lose the radiator valve.

If you have any concerns about any of the services in your home, please call us on **0800 131 3348** or **0300 123 3511**. We are here to help.
